The present sequence represents an antigenic epitope from a hepatitis C virus (HCV) NS4 protein. The peptide comprises amino acids 1916-1948 of the HCV polyprotein. The specification describes antigenic epitopes from HCV core protein, NS3 protein, NS4 protein and NS4a protein. The antigenic peptides are useful as diagnostic reagents for detecting HCV in a biological sample. They are also useful for monitoring HCV infection in a patient sample in addition to diagnosis. Pharmaceutical compositions comprising the peptides are useful for preventing, minimizing or reducing HCV infection in patients who have been exposed to HCV or to individuals, such as health care workers or blood product recipients, who are more likely to become exposed to HCV infection. The antigenic peptides are male also useful for generating antibodies which can be used to detect HCV proteins in a sample or for laboratory research purposes lagnosis Claim 5; Page 39; 52pp; English.

The genes encoding these proteins can each be used to prepare recombinant vectors by ligating the gene of interest in to a vector to be expressed in E. coli. These polypeptides are useful as diagnostic reagents for type C hepatitis and they may be produced efficiently by recombinant methods
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Hepatitis C virus antigen expressed as recombinant in E.coli - useful for diagnosis of hepatitis C virus infection.

The invention describes a polynucleotide vaccine comprising a polynucleotide sequence (S1) encoding the Hepatitis C virus (HCV) Core protein and at least 1 other HCV protein, and causes expression of the proteins in cells (in which (S1) has been mutated or positioned relative to the polynucleotide sequence encoding the other HCV protein, so that to the polynucleotide sequence encoding the other HCV protein, so that the other HCV protein is reduced). Also described are: a method of preventing or treating an HCV infection in a mammal, comprising administering the vaccine cited above to a mammal; and a method of vaccine is cited above, coating the polynucleotide onco gold beads and delivering the gold beads into the Akin. HCV nucleic acids, polymeptides, host cells, vectors and into the Akin. HCV nucleic acids, polymeptides, host cells, vectors and cantibodies used in the mannfacture of a medicament for the treatment of vaccine is useful in the mannfacture of a medicament for the treatment of HCV. This is the amnino acid sequence of the truncated HCV NS4B protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New Hepatitis C virus (HCV) vaccine having a polynucleotide that encodes the polypeptide sequences of the HCV core, NS3, NS4B and NS5B proteins, for use in medicine, in particular for manufacturing a medicament for the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             (HCV). The sequence is the translation sequence of a polynucleotide in which codon usage was altered to resemble that of highly expressed human genes. HCV vaccines of the invention comprise a polynucleotide that encodes the HCV proteins Core, NS3, NS4B and NS5B, and does not encode individual proteins. The proteins may be expressed as individual proteins or as fusion proteins. Preferred fusions include double fusions between NS4B and NS5B and NS5B.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               HCV; NS4A; vaccine; DNA immunisation; hepatotropic; virucide; mutant;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The sequences given in AAR25876-95 are encoded by the claimed hepatitis C virus genes of the invention which have been inserted into an E. coli vector. These polypeptides are useful as diagnostic reagents for type C hepatitis and they may be produced efficiently by recombinant DNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Hepatitis C virus antigen expressed as recombinant in E.coli - useful for diagnosis of hepatitis C virus infection.
vaccines are useful for the treatment or prevention of an HCV infection.

The sequences given in AAR29871-906 and AAR29533 are encoded by various clones of the NS4-NS5 regions of the Hepatitis C Virus (HCV) gene of the invention. These NS4-NS5 RAB sequencess were isolated from the serum of a patient suffering from hepatitis C (HC). The isolated RNA sequences were converted into cDNA using transcriptase in the presence of one of the converted into cDNA using transcriptase in the presence of one of the pring primer pairs. The cDNA sequences isolated represent different alleles of the same region of the HCV gene. Sequence analysis shows that these clones represent the core region and some upstream sequences of HCV. These polypeptides are thought to contain a highly hydrophilic region which can adopt a "turn structure" which is not an alpha helix or a beta sheet. These polypeptides are thought to act as antigen a beta sheet. These polypeptides are thought to act as antigen associated antigens. See also AAQ32436. (Updated on 25-MAR-2003 to correct PN field.)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The sequences given in AAR29871-906 and AAR29533 are encoded by various clones of the NS4-NS5 regions of the Hepatitis C Virus (HCV) gene of the include of the NS4-NS5 regions of the Hepatitis C Virus (HCV) gene of the patient solution. These NS4-NS5 RMA sequences were the serum of a patient suffering from hepatitis C (HC). The isolated RNA sequences were converted into cDNA using transcriptase in the presence of one of the converted into cDNA using transcriptase in the presence of one of the converted into cDNA using transcriptase in the presence of one of the converted into cDNA sequences isolated represent different alleles of the same region of the HCV gene. Sequence analysis shows that these clones represent the core region and some upstream sequences of the CV. These polypeptides are thought to contain a highly hydrophilic region which can adopt a "turn structure" which is not an alpha helix or a beta sheet. These polypeptides are thought to act as antigen associated antigens. See also AAQ32436. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö

```
The sequences given in AAR29871-906 and AAR29533 are encoded by various clones of the NS4-NS5 regions of the Hepatitis C Virus (HCV) gene of the interest of the NS4-NS5 regions of the Hepatitis C Virus (HCV) gene of the cinverted into the sequences were the serum of a patient suffering from hepatitis C (HC). The isolated RNA sequences were converted into cDNA using transcriptase in the presence of one of the converted into cDNA using transcriptase in the presence of one of the converted into cDNA sequences isolated represent different alleles of the same region of the HCV gene. Sequence analysis shows that these clones represent the core region and some upstream sequences of the converted and some upstream sequences of the the thought to contain a highly hydrophilic region which can adopt a "turn structure" which is not an alpha helix or a beta sheet. These polypeptides are thought to act as antigen a determinants and are highly reactive with antiserum raised against HCV-associated antigens. See also AAQ32436. (Updated on 25-MAR-2003 to correct PN field.)

```
The sequences given in AAR29871-906 and AAR29533 are encoded by various clones of the NS4-NS5 regions of the Hepatitis C Virus (HCV) gene of the invention. These NS4-NS5 RNA sequencess were isolated from the serum of a parient suffering from hepatitis C (HC). The isolated RNA sequences were converted into cDNA using transcriptase in the presence of one of the primer sequences given in AAQ32565-77. The sequences were then amplified using primer pairs. The cDNA sequences isolated represent different these clones represent the core region and some upstream sequences of HCV. These polypeptides are thought to contain a highly hydrophilic region which can adopt a frurn structure" which is not an alpha helix or region which can adopt a frurn structure" with a light of a beta sheet. These polypeptides are thought to act as antigen ceterminants and are highly reactive with antiserum raised against HCV-associated antigens. See also AAQ32436. (Updated on 25-MAR-2003 to

The sequences given in AAR29871-906 and AAR29533 are encoded by various clones of the NS4-NS5 regions of the Hepatitis C Virus (HCV) gene of the invention. These NS4-NS5 RNA sequencess were isolated from the serum of a patient suffering from hepatitis C (HC). The isolated RNA sequences were converted into cDNA using transcriptase in the presence of one of the primer sequences given in AAQ32565-77. The sequences were then amplified using primer pairs. The cDNA sequences isolated represent different calleles of the same region of the HCV gene. Sequence analysis shows that these clones represent the core region and some upstream sequences of HCV. These polypeptides are thought to contain a highly hydrophilic region which can adopt a "turn structure" which is not an alpha helix or a beta sheet. These polypeptides are thought to act as antigen associated antigens. See also AAQ32436. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö

                                                                                                                                                                                                                                                                                                                                                                                                              AAT04565 encodes AAR80044 a hepatitis C virus (HCV) antigenic sequence. An antigen derived from the antigenic sequence was combined with a carrier protein (maltose binding protein) to produce a fusion protein, which can be used for the highly sensitive detection of HCV

```
The sequences given in AAR29871-906 and AAR29533 are encoded by various CC clones of the NS4-NS5 RNA sequencess were isolated from the serum of a invention. These NS4-NS5 RNA sequencess were isolated from the serum of a converted into cDNA using transcriptase in the presence of one of the primer pairs. The cDNA sequences isolated RNA sequences were converted into cDNA using transcriptase in the presence of one of the primer pairs. The cDNA sequences isolated represent different amplified calledes of the same region of the HCV gene. Sequence analysis shows that these clones represent the core region and some upstream sequences of CHCV. These polypeptides are thought to contain a highly hydrophilic cregion which can adopt a "turn structure" which is not an alpha helix or a beta sheet. These polypeptides are thought to act as antigen cdeterminants and are highly reactive with antiserum raised against HCV-associated antigens. See also AAQ32436. (Updated on 25-MAR-2003 to

The sequence was deduced from a non-structural (3') coding region sequence isolated from serum of humans infected by the PT-NANBH virus. The polypeptide is an antigenic portion of the virus and will be useful in the development of vaccines for inducing immunity in man to PT-NANBH. The invention covers PT-NANBH viral polypeptides having an amino acid asquence at least 90 per cent homologous with the sequence given here, or antigenic fragments of such homologous sequences. See also AAQ12236-40 and AAQ12242. (Updated on 25-MAR-2003 to correct PA field.)

                                                              August 12, 2005, 14:04:54; Search time 9.24324 Seconds (without alignments) 266.510 Million cell updates/sec
                                                                                                                                                                                                                                                                                                                                                                                               Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Description
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Sequence

Capsid protein (Potential).
Matrix protein (Potential).
Major envelope protein E (Potential).
Nonstructural protein NS1/E2 (Potential).
Nonstructural protein NS2 (Potential).
Nonstructural protein NS3 (Potential).
Nonstructural protein NS4A (Potential).
Nonstructural protein NS4A (Potential).
                                         RNA! (W).
SUBUNIT: The virion of this virus is a nucleocapsid covered by lipoprotein envelope. The envelope consists of two proteins: protein M and glycoprotein E. The nucleocapsid is a complex of protein C and mRNA.
SIMILARITY: Contains 1 peptidase 829 domain.
SIMILARITY: Contains 1 peptidase W19 domain.
precursor polyprotein, commonly with Asp or Glu in the P6 position, Cys or Thr in P1 and Ser or Ala in P1. CATALYTIC ACTIVITY: N nucleoside triphosphate = N diphosphate (RNA)(N).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             115

"Molecular cloning of hepatitis C virus genome from a single Japanese carrier: sequence variation within the same individual and among carrier: sequence variation within the same individual and among carrier: sequence variation within the same individual and among the cred individuals.";

"Wicus Res. 23.953(1922).
-!- FUNCTION: The small proteins NS2A, NS2B, NS4A and NS4B are hydrophobic, suggesting a possible membrane-related function. NS3 and NS5 may play a role in the viral RNA replication.
-!- CATALYTIC ACTIVITY: Hydrolysis of four peptide bonds in the viral precursor polyprotein, commonly with Asp or Glu in the P6 position, Cys or Thr in Pl and Ser or Ala in Pl'.
-!- CATALYTIC ACTIVITY: N nucleoside triphosphate = N diphosphate + SUBUNIT: The virion of this virus is a nucleocapsid covered by a lipoprotein m and glycoprotein E. The nucleocapsid is a complex of protein c and mRNA.
-!- SIMILARITY: Contains 1 peptidase S29 domain.
-!- SIMILARITY: Contains 1 peptidase U39 domain.

SUBUNIT: The virion of this virus is a nucleocapsid covered by SUBUNIT: The virion of this virus is a nucleocapsid covered by lipoprotein envelope. The envelope consists of two proteins: protein M and glycoprotein E. The nucleocapsid is a complex of protein C and mRNA.
SIMILARITY: Contains 1 peptidase S29 domain.
SIMILARITY: Contains 1 peptidase U39 domain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               | HCV_NSI.

Khudyakov YE; Fields HA,

WPI; 2001-138316/14.

New (mosaic) polypeptides, useful as reagents in assays for the diagnosis or monitoring of HCV infections and as components of anti-HCV vaccines, comprises antigenic groups of hepatitis C virus (HCV).

Claim 6; Page 39; 52pp; English.

The present sequence represents an antigenic epitope from a hepatitis C virus (HCV) NS5a protein. The peptide comprises amino acids 2322-2423 of the HCV polyprotein. The specification describes antigenic epitopes from HCV core protein, NS3 protein, NS4 protein and NS4a protein. The antigenic peptides are useful as diagnostic reagents for detecting HCV in a biological sample. They are also useful for monitoring HCV infection in apatient sample in addition to diagnosis. Pharmaceutical compositions comprising the peptides are useful for preventing, minimizing or reducing HCV infection in patients who have been exposed to HCV or to individuals, such as health care workers or blood product recipients, who are more likely to become exposed to HCV infection. The antigenic peptides are also useful for generating antibodies which can be used to detect HCV proteins in a sample or for laboratory research purposes

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      This protein from HCV (hepatitis C virus) (encoded by AAQ80498) is cleaved between amino acids 2419 and 2420, by a new serine protease, contg. the sequence of AAR68621. The proteinses is purified as a fused product with the dihydrofolate reductase protein by using a methotrexate column. It can be used for the development of an inhibitor for HCV proteinase. (Updated on 16-OCT-2003 to standardise OS field)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to the novel testing method for diagnosing liver cancer. The novel method comprises amplifying the amino terminal region of a hepatitis-C virus NS3 gene using a predetermined primer and determining the hepatitis-C virus in a base sequence of the obtained DNA fragment. The novel testing method is useful for diagnosing liver cancer and also used in a gene amplification technique, a clinical laboratory test reagent, a polymerase chain reaction, a base sequence analysis and genetic engineering. The method enables the detection of a hepatitis-C virus having high carcinogenicity with high specificity. This sequence represents the protein of the hepatitis-C virus NS3 gene of the
from the non-structral region. Partial proteinase sequences (AAR82692-93) are contained within this sequence. The proteinases can be used as anti-HCV agents. They can also be used to screen cpds. for their ability to inhibit their proteclytic activity. In this way proteinase inhibitors can be identified. (Updated on 16-OCT-2003 to standardise OS field)
